The present invention describes an isolated or synthetic polypeptide

(I) comprising a less than full length amino acid sequence of a mutant

Ball acid. 2 associated cell death regulator polypeptide (BAD) or its

fragment, which contains amino acid substitutions at Seril8 of a human

Expansion of a murine BAD. (I) has immunostimulant, neuroprotective,

BAD (shorter murine BAD). (I) has immunostimulant, neuroprotective,

nootropic, antifichaemic, vulnerary, cytostatic, antiviral,

antiarthritic, antiniflammatory and immunosuppressive activities, and

can be used as an apoptosis inducer or inhibitor. BAD polypeptides and

polynucleotides can be used for screening candidate compounds and drugs

for activity that promote cell survival or apoptosis. Other uses include

inducing or inhibiting apoptosis in a cell. Candidate compounds

identified and (mutant) BAD polypeptides are useful in treating

immunodeficiency diseases, neurodegenerative diseases, ischaemic cell

death, reperfusion cell death, wound healing, cancer, viral infections,

autoimmune diseases. The present sequence represents a specifically

claimed shorter murine BAD mutant amino acid sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Epitope; murine; bcl-x(L)/bcl-2 associated death promoter; Bad; stroke; polypeptide; bcl-x; cell death; regulate; BH1; BH2; apoptotic cell death; cytokine deprivation; IL-3 dependent cell line; immunodeficiency; AIDS; neurodegenerative disease; senescence; ischaemia; neoplasia.

```
The present invention describes mutant bab (BLLTAL/BLLT associated cell death regulator) proteins, having an amino and other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The position 112 and/or 136, relative to the murine BAD 204 as sequence. The fragments of mutant BAD protein. Also described are: (1) fragments of mutant BAD with a heterologous polypeptide that concrases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, infertion, lymphoproliferation, arthritis, infertility, infertion and autoimmune disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD creaming the specified Ser are used to screen for enhancers of inhibitors of serine-phosphatase. Inhibitors are potentially useful intendent of excessive apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphorylated bab, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not beterodiments with BCL-2 or BCL-XL but instead binds to 14-3-3 family but the cytosol, thus promoting cell survival. The mutants with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Dp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ДX
                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the murine bcl-x(L)/bcl-2 associated death promoter (Bad) gene. Bad is a 22.1 kD protein which interacts with bcl-2 and bcl-x proteins and regulates cell death. It has homology to the bcl-2-related family clustered in the BH1 and BH2 domain. Bad has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid assays and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of bcl-x(L), but is much less effective at countering the death inhibitory activity of bcl-x(L). Bad expression can accelerate apoptotic cell death induced by cytckine deprivation in an IL-3 dependent cell line expressing bcl-x(L). Bad competes with Bax for binding to bcl-x(L). Bad may be used to identify agents which inhibit its binding to bcl-x(L) to form heterodimers. Such agents may be used to treat neurodegenerative diseases, immunodeficiency diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δŏ
                                                                                            The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 aa sequence. The present sequence represents a mutant BAD protein. Also described are: (1) I fragments of mutant BAD protein able to decrease cell viability; (2) increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serime-phosphatase. Inhibitors are potentially useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection.
                                                                                                                                                                                                                                                                                                        phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                     in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-
                   New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                               0;

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The position 12 and/or 136, relative to the murine BAD 204 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, infertility, infertility infarmation and autoimmune disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphorylated and the specified Ser, forming a product that does not phosphorylated on the specified Ser, forming a product that does not proteins in the cytosol, thus promoting cell survival. The mutants with cell ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 serine substituted mutant; apoptosis; cancer; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 204;

                                                                                                                                  death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, viral infection, lymphoproliferation, arthritis, infertility, mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful
                                                                                                                    present invention describes mutant BAD (BCL-XL/BCL-2 associated cell
                                                                                                                                                                                                                                                                                                                                                                                       in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BAD protein, Bcl-XL/Bcl-2 associated cell death regulator; 14-3-3; serine phosphorylation; post-translational modification; apoptosis; signal transduction regulator; phosphoserine phosphatase; senescence; immunodeficiency disease; neurodegenerative disease; infertility; cancer, viral infection; lymphoproliferative condition; arthritis; inflammation; autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0

This sequence represents a novel serine-phosphorylated protein, BAD

(Bc1-X1/Bc1-2 associated cell death regulator). The serine residue is
phosporylated in a post-translational modification and allows binding

to the 14-3-3 protein which is a signal transduction regulator.

Modulators of phosphorylated BAD, which act through inhibition/activation

of a phosphoserine phosphatase, are useful for preventing/treating

increased/decreased apoptosis in a cell. The increased apoptosis may

result from immunodeficiency diseases, senescence, neurodegenerative

disease, isohaemic cell death, repertusion cell death, infertility and

wound-healing. Decreased apoptosis may result from cancer, viral

infection, lymphoproliferative conditions, arthritis, infertility.

inflammation and autoimmune diseases. Measuring the amount of

thosphorylated compared to unphosphorylated BAD polypeptide and/or total

EAD in a cell is useful for determining the apoptotic state of a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bcl-XL/Bcl-2 associated cell death regulator; BAD; mutant; apoptosis; immunostimulant; neuroprotective; nootropic; antiischaemic; vulnerary; cytostatic; antiviral; antiarthritic; antiinflammatory; wound healing; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infection; lymphoproliferative condition; inflammation; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New mutant Bcl-XL/Bcl-2 Associated Cell Death Regulator polypeptide, useful for screening for candidate compounds which induce or inhibit apoptosis, comprises amino acid substitutions at Serl18, Serl55 or Serl13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
            Serine-phosphorylated Bcl-X-1/Bcl-2 Associated cell Death regulator polypeptide - useful for modulation of apoptosis associated with, e.g. cancer and immunodeficiency diseases

                                                                                                                                                                                                                                                                                        δ
                            The present invention describes an isolated or synthetic polypeptide

(I) comprising a less than full length amino acid sequence of a mutant

BC1-XL/BC1-2 associated cell death regulator polypeptide (BAD) or its

fragment, which contains amino acid substitutions at Seril8 of a human

BAD, SeriS5 of a mutine BAD (longer murine BAD) or Seril3 of a murine

BAD (shorter murine BAD). (I) has immunostimulant, neuroprotective,

nootropic, antischaemic, vulnerary, cytostatic, antiviral,

antiarthritic, antiinflammatory and immunosuppressive activities, and

can be used as an apoptosis inducer or inhibitor. BAD polypeptides and

con be used as an apoptosis in a cell. Candidate compounds and drugs

for activity that promote cell survival or apoptosis. Other uses include

inducing or inhibiting apoptosis in a cell. Candidate compounds

identified and (mutant) BAD polypeptides are useful in treating

immunodeficiency diseases, neurodegenerative diseases, ischaemic cell

death, reperfusion cell death, wound healing, cancer, viral infections,

claimed longer murine BAD mutant amino acid sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method (M1) for inducing apoptosis in a cell infected with herpes simplex virus (HSV), which comprises administering to the cell, a composition having an agent that inhibits phosphorylation of pro-apoptotic polypeptide BAD by HSV US3. modifying fusion protein comprising Bad gene sequence fused via a short
linker to diphtheria toxin translocation domain (DTTR). The
functional apoptosis-modifying fusion protein is capable of binding a
target cell and integrating into or crossing a cellular membrane of the
described is a method (MZ) for treating a patient infected with HSV, by administering to the patient, a composition comprising a peptide comprising a sequence of 4-100 continuous amino acids of a 168 residue amino acid sequence (see ABR39081), where the peptide comprises ser112, ser135, or their combinations. BAD has virucide activity. MI is useful for inducing apoptosis in a cell infected with HSV, where the cell is in a human. MZ is useful for treating a patient infected with HSV. The present sequence represents murine BAD, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel fusion protein for modifying apoptosis in target cell and reducing apoptosis after transient ischaemic neuronal injury, has two domains which targets protein to a cell and modifies apoptotic response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diphtheria toxin receptor binding domain; DTR; neoplasm; tumour; hyper-proliferation; Alzheimer's disease; neurodegenerative disorder; transient ischaemic neuronal injury; stroke; spinal cord injury;

target cell. The apoptosis-modifying fusion protein comprises at least two domains: the DTR domain, which targets the fusion protein to the target cell and the BCl-XL domain, which modifies an apoptotic response of the target cell. The fusion protein is useful for modifying (inhibiting or enhancing) apoptosis in a target cell, such as neuron, lymphocyte, cancer, neoplasm, macrophage, epithelial, stem, tumour or hyper-proliferative cell or an adipocyte. It is also useful for reducing apoptosis in a subject after transient ischaemic neuronal injury, especially spinal cord injury. The fusion protein may be used to treat various diseases and injury. The fusion protein may be used to treat to apoptotic cellular response, including neurodegenerative disorders such as Albeiment's disease, including neurodegenerative disorders attophy, stroke episodes and unrequiated cell growth as in tumours and effectively throughout the body and targeted to selective tissue and
                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a peptide conjugate having the formula: (R-X)n\text{-peptide} where n=1\text{-}10; X=C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain of the peptide, or N=0 or NH, when the R-X group is attached to the C-terminus of the peptide, or a side chain of the peptide, where the side chain functional group is COOH
                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; neuroprotective; anti-HIV; virucide; cerebroprotective; cardiant; Bcl-2 superfamily; BH3 domain; cell death agonist; Bad; apoptosis modulation; B cell lymphoma/leukemia 2; cancer; prostate; colorectal; gastric; non-small lung; renal; thyroid; neuroblastoma; melanoma; lymphocytic leukemia; neurodegenerative disorder; AIDS; stroke; myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide conjugates for modulating apoptosis or for inhibiting cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer

or CONHZ; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, competitions alkyl group, or benzyl. The peptides AAB37001-B37058 represent examples of the peptide portion of the conjugate. The peptides represent analogues of a Bcl-2 superiamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the cell death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for useful for modulating apoptosis in the cells of a subject, or for apoptosis in cancer cells. It is also useful for inhibiting Bcl-2 function. In particular, the peptide conjugate is useful for treating a subject affilicted with a cancer characterized by cancer cells that express Bcl-2. The cancer includes prostate, colorectal, gastric, non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a peptide conjugate having the formula: (R-X)n-peptide where n=1-10; X=C=0, when the R-X group is attached to the N-terminus of the peptide, or a side chain of the peptide where

when the R-X group is attached to the C-terminus of the peptide, or a side chain of the peptide, where the side chain functional group is COOH or COOH2; and R = 2.18C alkyl or alkoxy, 2.14C alkylenyl containing one or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides ABB37001-B37058 represent examples of alkyl group, or benzyl. The peptides ABB37001-B37058 represent analogues of a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the conjugate. The peptides represent analogues of a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the cell death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting Bcl-2 function. In particular, the peptide conjugate is useful for treating a subject afflicted with a cancer characterized by cancer cells that cancer cancer includes prostate, colorectal, gastric, or corresponding remain or thyroid cancers, neuroblastoma, melanoma, or acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached

to the N-terminus of the peptide, or a side chain of the peptide where

the functional group of the side chain is NH2 or NH; or X = O or NH,

when the R-X group is attached to the C-terminus of the peptide, or a

conditional group of the side chain functional group is conditionally or alkoy, 2-14C alkylenyl containing one

conducted with a 1-5C straight or branched chain alkyl group,

conductionally monosubstituted with a 1-5C straight or branched chain

contwo double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally

contwo double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally

contwo double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally

contwo benzyl. The peptides AAB37001-B37058 represent examples

contwo benzyl. The peptide corresponding to amino acids 72-97 of

alkyl group, or benzyl. The peptide corresponding to amino acids 72-97 of

contained by the cell death agonist Bad. The peptide conjugate is

contained to modulating apoptosis in the cells of a subject, or for

constitution. In particular, the peptide conjugate is useful for treating a

confunction. In particular, the peptide conjugate is useful for treating a

confunction. In particular, the peptide conjugate is useful for treating a

cute or chronic lymphocytic and non-lymphocytic leukemia. The peptide

conjugate is also useful for treating disorders characterized by

increased apoptosis, e.g. neurodegenerative disorders, acquired

immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Д

```

```
The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached

to the N-terminus of the peptide, or a side chain of the peptide where

to the functional group of the side chain is NH2 or NH; or X = O or NH,

when the R-X group is attached to the C-terminus of the peptide, or a

conside chain of the peptide, where the side chain functional group is CODH

con two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally

con convexituted with a 1-5c straight or branched chain alkyl group,

con two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally

con two double bonds, cyclobutyl, cyclopentyl, cyclohexyl or branched

colored alkyl group, or benzyl. The peptides Anb37001-B37058 represent analogues

colored BB1-2 superfamily polypeptide orresponding to amino acids 72-97 of

colored BB1 domain of the cell death agonist Bad. The peptide conjugate is

colored bonds of the cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of

apoptosis in cancer cells. It is also useful for inhibiting BC-2

conjugate is also useful for treating disorders characterized by

conjugate is also useful for treating disorders characterized by

conjugate is also useful for treating disorders characterized by

conjugate is also useful for treating disorders cancer informed infanction.

conjugate is also useful for treating disorders cancers acquired

immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                  Claim 18; Page 19; 74pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                               inter-alpha-inhibitor H2 chain - mouse
C; Species: Mus musculus (house mouse)
C; Date: 15-Jul-1995 #sequence_revision 01-Sep-1995 #text_change 20-Aug-1999
C; Accession: S54354
R; Chan, P:: Risler, J.L.; Raguenez, G.; Salier, J.P.
Biochem. J: 306, 505-512, 1995
A; Title: The three heavy-chain precursors for the inter-alpha-inhibitor family in mouse:
A; Reference number: S54353; MUID:95194326; PMID:7534067
A; Status: preliminary; nucleic acid sequence not shown
A; Molecule type: mRNA
A; Residues: 1-946 <CHA>

"Functional characterization of two splice variants of rat BAD and
their interaction with Bol-w in sympathetic neurons.";

Their interaction with Bol-w in sympathetic neurons.";

Mol. Cell. Neurosci. 17:97-106(2001).

Cell. Neurosci. 17:97-106(2001).

Dinding to Bol-x(L), Bol-2 and Bol-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bol-x(L), but not that of Bol-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

C. -: SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bol-x(L), Bol-2 and Bol-w. Also binds protein Sl00Al0. The Ser-113/Ser-137 phosphorylated form binds l4-3-3 proteins.

C. -: SUBCELLULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. -i-TISSUE SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more abundant form.

-i-DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptoric members of the Bcl-2 family.

-i-PTW: Phosphorylated on Ser-133 in response to survival stimuli.

Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-136 a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival.

Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the major site of protein kinase A (CAPK) phosphorylation (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LPRPKSAGTATQMRQSASWTRIIQSWWDRNLGKGGSTPSQ

SIMILARITY.).

C. SIMILARITY.).

C. SIGCELLIDIAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.

C. TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.

C. DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND RAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the BBL-2 family.

C. PTM: Phosphorylated on Ser-75 in response to survival stimuli.

Subsequent phosphorylation on Ser-99 promotes heterodimerization to hosphorylation at Ser-18, a site within the BH3 domain, leading to the release of BGL-x(L) and the promotion of cell survival.

Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the major site of protein kinase A (CAPK) phosphorylation (by

FUNCTION: Probable transcription factor involved in the genetic control of flower development. Is required for normal development of petals and stamens in the wild-type flower. Forms an heterodimer with PISTILLATA that is required for autoregulation of both AP3 and PI genes. AP3/PI heterodimer interacts with APETALA1 or SEPALMATA3 to form a ternary complex that could be responsible for the regulation of the genes involved in the flower
                                                                                                                                                                       -:- SUBCELLULAR LOCATION: Nuclear.
-:- TISSUE SPECIFICITY: Expressed in petals and stamens.
-:- TISSUE SPECIFICITY: Expressed in petals and stamens.
-:- INDUCTION: Positively regulated by the meristem identity proteins APETALAI and LEAFY with the cooperation of UFO.
-:- MISCELLANEOUS: Mutations in AP3 cause transformation of petals into sepals and stamina into carpels.
-:- SIMILARITY: BELONGS TO THE MADS DOMAIN FAMILY OF TRANSCRIPTION
                                                                                                                             SUBUNIT: Forms an heterodimer with PISTILLATA, capable of binding to CArG-box sequences. AP3/PI heterodimer binds AP1 or SEP3 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Corsacalla-1).

Reneration and initial analysis of more than 15,000 full-length

Ruman and mouse cDNA sequences.

R. Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

Proc. Instrantive Belongs to the FAM13 family.

- I - SIMILARITY: Contains 1 Rho-GAP domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright.
